

SAP Capabilities

SAP TECHNOLOGY CAPABILITIES AND IMPLEMENTATION STANDARDS

SAP BUSINESS ONE: RAPID ERP DEPLOYMENT

PRODUCT OVERVIEW

SAP Business One is an ERP platform for small and mid-sized businesses, covering finance, sales, purchasing, inventory, and production in a single integrated system. Gauri positions itself as a specialist implementer for growth-stage companies requiring operational transformation within months rather than years.

GAURI'S COMPETITIVE POSITIONING

- Compressed, template-accelerated implementation timelines
- Fast-growing distribution and light-manufacturing specialisation
- Three-month rapid deployment demonstrated with Micro Tech UK
- Professional, seamless handoff from day one of engagement
- Ideal for businesses that cannot absorb lengthy, disruptive rollouts

DELIVERY APPROACH FRAMEWORK

Timeline: 3-month template-accelerated implementation

Methodology: Compressed deployment with pre-configured templates

Scope Intensity: Managed carefully to maintain quality in rapid delivery

Knowledge Transfer: Training delivered by same consultants who configured system

Post-Go-Live: Adoption support to ensure system stickiness

REPRESENTATIVE SCOPE OF BUSINESS ONE ENGAGEMENTS

1. Core Financial Ledger Configuration
 - General ledger setup and account planning
 - Multi-currency and multi-entity configurations where required
 - Tax and regulatory compliance for UK and European operations
 - Reconciliation account setup
2. Sales Order and Purchasing Workflow Design
 - End-to-end sales order workflow from quote to invoice
 - Purchasing process design including supplier management
 - Approval hierarchies and authorisation matrices
 - Discount structures and pricing rules
 - Returns and credit-note workflows
3. Inventory and Warehouse Management
 - Stock level configuration and reorder points
 - Warehouse layout and bin management
 - Pick, pack, and ship process design
 - Inventory valuation methods (FIFO, weighted average, standard cost)
 - Physical count and cycle counting procedures
 - Serial number and batch tracking where applicable
4. Integration with Existing Ecosystems
 - E-commerce platform integration for automated order intake
 - EDI (Electronic Data Interchange) with trading partners
 - Logistics system integration for shipping and tracking
 - Third-party accounting or reporting tool connectivity
 - API-based integration for specialised business systems
5. User Training and Adoption Support
 - Delivered by implementation consultants, not separate training team
 - Role-based training (finance, sales, purchasing, warehouse)

- Hands-on, scenario-based practise in sandbox environment
- Job aids and process documentation
- Super-user identification and train-the-trainer approach
- Post-go-live hypercare and support

BUSINESS ONE CLIENT USE CASES

Distribution Businesses: Order-to-cash processing for high-volume, low-complexity operations

Light Manufacturing: Production planning and inventory control for made-to-order or made-to-stock models

Healthcare-Adjacent Supply: Device and consumable distribution with lot/serial traceability requirements

Fast-Growing SMEs: Businesses outgrowing spreadsheet-based operations but not yet requiring S/4HANA complexity

KEY SUCCESS FACTOR: SPEED TO VALUE

Micro Tech UK case study evidence: 3-month deployment from contract to production, delivering SAP Business One for a distributor of endoscopy devices to NHS and private hospitals.

Client testimony: "An excellent platform for growth" and "an outstanding partner to implement it."

INTEGRATION WITH WIDER GAURI STACK

Data & AI Layering: Where relevant, Gauri applies document intelligence (Setu-AI) on top of Business One

Example: Automated inbound purchase-order and invoice capture into Business One, reducing manual data entry for distribution-heavy clients

Outcome: Multiplies ROI of both systems through reduced manual intervention

SAP S/4HANA CLOUD ERP: ENTERPRISE TRANSFORMATION

PRODUCT POSITIONING

SAP S/4HANA Cloud ERP is SAP's flagship enterprise resource planning suite, built on the in-memory HANA database and designed for large, complex organisations. Gauri describes it as delivering "innovation and best practices" for enterprises moving away from legacy on-premise ERP toward modern, cloud-based architecture.

GAURI'S S/4HANA STRATEGY

Not just implementation, but ongoing extensibility and support challenges

Published resource content on S/4HANA Cloud ERP extensibility mechanisms

Expertise in safe customisation without breaking ability to take standard SAP updates

Focus on managed services model extending beyond go-live

REPRESENTATIVE SCOPE OF S/4HANA ENGAGEMENTS

1. Business Process Design Aligned to SAP Best Practice

- Fit-to-standard analysis against SAP's reference process models
- Gap identification and change impact assessment
- Business case development for process redesign
- Stakeholder workshops to gain alignment on future state
- Process documentation and RACI (Responsible, Accountable, Consulted, Informed) matrices

2. Clean-Core Extensibility Design

- Side-by-side extensions built on SAP Business Technology Platform (BTP)
- Avoidance of core modifications that block standard updates
- API-first integration approach for custom logic
- Cloud Functions and Intelligent Services for extensibility
- Preserves upgrade path and maintains support eligibility

3. Data Migration from Legacy Systems

- Complex data mapping from on-premise ECC or third-party ERP
- Data cleansing and validation before migration
- Master data governance and deduplication
- Historical data archival strategy
- Parallel run validation and cutover planning
- Post-go-live data reconciliation

4. Salesforce-SAP Integration

- Unified customer master (SAP) with Salesforce CRM
- Order-to-cash process integration
- Real-time or batch synchronisation strategies
- Quote-to-order workflow automation
- Revenue recognition alignment

5. Third-Party Supply Chain Tool Integration

- Slim4 supply chain visibility integration (Roper Rhodes case study)
- Logistics provider connectivity
- Demand planning and forecasting system integration
- Procurement analytics platform connections
- Unified supply chain visibility

TRANSFORMATION SCALE EVIDENCE

Synthomer Case Study: Global CRM and ERP transformation combining Salesforce and SAP work across multiple countries, demonstrating S/4HANA capability for large-scale, multi-country transformation rather than single-entity rollouts.

MANAGED SERVICES BEYOND GO-LIVE

Recognition: Most total cost and risk of ERP investment occurs in years after cut-over, not during implementation project itself

Service Offerings:

- Application support and incident management
- Patching and security update management
- Incremental enhancement and optimisation
- Performance monitoring and tuning
- Change management for new functionality
- User enablement for new features

SAP BUSINESS TECHNOLOGY PLATFORM (BTP): EXTENSIBILITY LAYER

STRATEGIC ROLE

BTP serves as the recommended extension and integration layer for S/4HANA and SAP Business AI

Enables "clean core" approach: custom logic and extensions built alongside SAP's cloud ERP rather than modifying core

Preserves client's ability to take standard SAP upgrades without conflict

TECHNICAL CAPABILITIES

Cloud Functions for serverless business logic

Intelligent Services for ML and AI capabilities

Integration Suite for API management and B2B connectivity

Data stewardship and governance tools

Low-code/no-code application development (Appgyver)

Mobile development framework (CAP)

GAURI IMPLEMENTATION PATTERNS

Custom workflow extensions without core modifications

API-based integrations with third-party systems

Real-time and batch data synchronisation patterns

Event-driven architecture for inter-system communication

Microservices-based extension patterns

SAP BUSINESS AI: EMBEDDED INTELLIGENCE

POSITIONING

Embedded copilots across SAP's cloud ERP suite providing contextual assistance and process guidance

Part of Gauri's AI-ready enterprise stack positioning

Generative AI capability built into core SAP processes rather than bolted on

REPRESENTATIVE USE CASES

Copilot-assisted process guidance within S/4HANA Cloud

Procurement assistant for purchase order creation

Sales order entry assistant with compliance checking

Invoice processing with automatic account coding suggestions

Demand forecasting based on historical patterns and market data

GOVERNANCE-FIRST APPROACH

Framed around governed data foundations and clear use-case boundaries

Positions Gauri against ungoverned experimentation

Board-level framing: controlled AI deployment with measurable ROI, not speculative pilots

TECHNOLOGY STACK INTEGRATION PHILOSOPHY

SYSTEMS INTEGRATION APPROACH

Gauri views SAP Business One and S/4HANA not as standalone deployments but as core nodes in an integrated business system architecture including Salesforce, data platforms, and intelligence layers.

TYPICAL INTEGRATED LANDSCAPE

Customer Relationship Management (Salesforce) ↔ Enterprise Resource Planning (SAP) ↔ Data Platform (Lakehouse) ↔ Analytics and AI Layer

Supporting tools: Talend for ETL/ELT, Setu-AI for document intelligence, ThoughtSpot for self-service analytics

GOVERNED DATA AS FOUNDATION

All SAP implementations supported by governed data architecture

Master data governance standards applied across systems

Data quality rules and lineage tracking as first-class deliverables

Access governance aligned to role-based permissions in SAP

QUALITY ASSURANCE AND SUPPORT STANDARDS

TESTING FRAMEWORKS

Unit testing for any custom development on SAP BTP

Integration testing across SAP, Salesforce, and third-party systems

User Acceptance Testing (UAT) in client-provided environments aligned to change control

Performance testing for data-heavy processes (reporting, mass posting, migration)

DEPLOYMENT STANDARDS

Production deployments during agreed change windows (typically outside business hours for ERP)

Tested rollback procedures before every go-live

Post-deployment verification with smoke testing and business metrics monitoring

Documentation of changes in compliance with client requirements

INCIDENT RESPONSE FOR SAP SYSTEMS

P1 (Critical): Immediate 24/7 support for system downtime or data loss

P2 (High): Major function unavailable within 1 hour business hours

P3 (Medium): Feature not working with workaround within 4 business hours

P4 (Low): Cosmetic issues or enhancement requests within 1 business day
