

# Case Studies

## GAURI CLIENT CASE STUDIES: PORTFOLIO OF SUCCESSFUL IMPLEMENTATIONS

### AUTOMOTIVE SECTOR: KESTREL AUTOMOTIVE GROUP

#### CLIENT PROFILE

Business: UK automotive dealer and service group operating 14 dealership sites across the Midlands and North of England

Representation: Three vehicle brands across multiple franchises

Size: Multi-location regional dealer network with combined sales, service, and parts operations

Challenge Scope: Legacy systems fragmentation, manual processes, geographic isolation

#### BUSINESS PROBLEM

Fragmented IT Infrastructure: Each dealership ran locally managed systems with minimal integration to central CRM

Lead Management Inefficiency: Online sales leads manually re-keyed into dealership systems, resulting in late and inconsistent follow-up

Service Operations Dependency on Spreadsheets: Service scheduling and warranty claims managed through disconnected spreadsheets with no mobile capability

Legacy ERP Vulnerability: Group's ageing on-premise ERP approaching end-of-vendor support with no modernisation plan

#### IMPACT OF PROBLEMS

Sales Leakage: Delayed lead response meant lost sales opportunities

Service Delays: Manual scheduling and claim processing created customer frustration and inefficiency

Reporting Opacity: No group-wide reporting on sales, service, or profitability

Scaling Risk: Business growth impossible with legacy infrastructure

#### GAURI'S SOLUTION ARCHITECTURE

1. Salesforce Consolidation (Sales and Service Cloud)
  - Single unified Salesforce instance replacing local dealership systems
  - Unified sales lead capture and opportunity management across all 14 sites
  - Centralised customer record with dealership-level service history
  - Real-time lead routing and auto-assignment reducing lead response time
2. Salesforce Field Service Lightning Deployment
  - Mobile workforce app for technician scheduling, dispatch, and job completion
  - Automated job assignment based on technician availability and proximity
  - Mobile-first warranty claims management with photo and signature capture
  - Real-time customer communication and scheduling updates
3. SAP Business One for Finance and Inventory
  - Migration of parts inventory and financial operations to unified SAP Business One
  - Centralised parts procurement reducing redundant inventory across sites
  - Month-end close automation and GL consolidation
  - Warranty claims integration with SAP for proper accrual and reserves
4. Governed Data Foundation
  - Cloud-based data lakehouse integrating Salesforce and SAP data
  - Unified customer and vehicle database across all 14 sites
  - Single source of truth for sales pipeline, warranty claims, and inventory
5. Agentforce Pilot (Agentic AI)
  - Autonomous AI agent for triaging routine service-booking enquiries
  - Natural language handling of common requests (routine maintenance, tire rotation, inspection)
  - Escalation to human agent for complex requests or new customer inquiries
  - Reduction in support team volume allowing focus on complex cases

#### TECHNOLOGIES IMPLEMENTED

Primary: Salesforce Sales Cloud, Salesforce Service Cloud, Salesforce Field Service Lightning, SAP Business One

Supporting: Cloud data lakehouse, Agentforce AI agent

Integration: Real-time synchronisation between Salesforce and SAP for inventory and financial data

## KEY RESULTS

Lead Response Time: Reduced from over 24 hours to under 2 hours

Warranty Claim Processing: Time more than halved from manual spreadsheet-based processing

Month-End Close: Reduced from three weeks to under one week

Agentforce Pilot: Meaningful share of routine service-booking enquiries resolved without human intervention

Operational Efficiency: Dealerships now operate from unified platform rather than disparate systems

## BUSINESS OUTCOMES

Improved Customer Experience: Faster sales response and service booking

Competitive Advantage: Faster, more professional service vs. competitors

Geographic Scaling: Unified systems support expansion without proportional overhead increase

Data-Driven Management: Group executives now have real-time visibility to sales, service, and profitability

## DEPLOYMENT TIMELINE

Project Duration: 6-month implementation timeline

Phases: Discovery and design (month 1-2), build and configuration (month 3-4), testing and training (month 5), go-live and hypercare (month 6)

Go-Live Approach: Phased rollout across dealership sites reducing disruption

## EDUCATION SECTOR: WENTWORTH REGIONAL COLLEGE GROUP

### CLIENT PROFILE

Business: Regional further-education college group with 4 campuses across the UK

Scale: Approximately 18,000 students across all campuses

Scope: Combined admissions, alumni relations, and fundraising operations

Challenge: Geographically dispersed campuses with fragmented student data

### BUSINESS PROBLEM

Paper-Based Admissions: Student applications captured through paper and PDF forms, manually re-keyed into legacy admissions system

Peak Period Bottlenecks: Enrolment processing delays during peak seasons due to manual data entry

Data Fragmentation: Student records inconsistent across campuses due to local variations in data entry

Disconnected Alumni and Fundraising: Separate, ageing system for alumni and donor relations with no link to admissions data

Compliance Complexity: Multiple student privacy and GDPR obligations across four geographies

### IMPACT OF PROBLEMS

Administrative Overhead: Significant manual labour required for application processing

Applicant Experience: Slow application processing and communication during critical decision window

Lost Revenue: Alumni engagement and fundraising limited by lack of prospect data and engagement history

Compliance Risk: Student data privacy obligations difficult to enforce without system controls

## GAURI'S SOLUTION ARCHITECTURE

### 1. Salesforce Education Cloud Deployment

- Unified platform for admissions, student records, alumni, and fundraiser across all 4 campuses
- Single view of prospective student from application through enrolment to alumni
- Centralised communication platform for application status updates, alumni newsletters, and fundraising campaigns
- Mobile-accessible portal for alumni engagement

### 2. Setu-AI Document Intelligence Integration

- Automated extraction of applicant data from scanned application forms

- Transcript parsing extracting academic history, grades, achievements
- Automatic linking of additional documents (references, certifications) to applicant records
- 80% reduction in manual re-keying during peak enrolment periods

### 3. Campus Integration and Governance

- Role-based access controls aligned to campus and department
- Student data access governance ensuring GDPR compliance
- Campus-specific workflows (e.g., domestic vs. international student processes)
- Unified reporting across all campuses for central leadership visibility

### 4. Data Quality and Validation

- Duplicate detection and merging for applicants applying to multiple campuses
- Automated validation of application completeness
- Error detection before submission to avoid processing delays

## TECHNOLOGIES IMPLEMENTED

Primary: Salesforce Education Cloud, Setu-AI document intelligence

Supporting: Governed data access controls, integration with college finance system

Integration: Connection to student information system (SIS) legacy system during transition

## KEY RESULTS

Application Data Re-keying: Reduced by approximately 80% through Setu-AI automation

Application Processing Time: Fell by more than one-third during busiest enrolment window

Student Records Consistency: Single, unified view of prospective and current students across 4 campuses

Compliance Improvement: Clear audit trail of all student data access and changes

System Availability: Reduced peak-period system load on legacy admissions system

## BUSINESS OUTCOMES

Improved Applicant Experience: Faster application processing and status communication

Increased Enrolment Capacity: Ability to handle higher application volume without proportional overhead

Alumni Engagement: Unified alumni database enabling targeted fundraising campaigns

Data-Driven Admissions: Analytics on application sources, conversion rates, and student characteristics

## DEPLOYMENT TIMELINE

Project Duration: 4-5 month implementation

Phasing: Core Education Cloud (month 1-3), Setu-AI integration and training (month 4), pilot with peak enrolment (month 5)

## HEALTHCARE SECTOR: MEDIVANCE SURGICAL SUPPLIES

### CLIENT PROFILE

Business: Distributor of surgical and endoscopy devices to NHS hospital trusts and private hospital groups

Customer Base: 200+ NHS trusts and private hospitals across UK

Product Range: Specialised surgical instruments, endoscopes, and related consumables

Regulatory Context: Strict batch and serial traceability requirements for medical devices

### BUSINESS PROBLEM

Legacy System Sunset: Existing ERP system approaching end-of-vendor support with critical business-continuity implications

Compressed Timeline: Tight window to implement replacement system before legacy system end-of-life

Trust Procurement Complexity: Hospital trust customers require strict batch/serial traceability and compliance documentation

Manual Supplier Matching: Supplier documentation matching to purchase orders was almost entirely manual, creating delays

Peak Period Bottlenecks: High-volume ordering periods (seasonal demand, pandemic-driven surges) exposed manual process fragility

## IMPACT OF PROBLEMS

Business Continuity Risk: Uncertain timeline for replacement system could result in operations shutdown

Customer Relationships: Inability to prove lot and serial traceability could result in loss of NHS contracts

Operational Inefficiency: Manual purchase-order-to-delivery-note matching created delays in processing and invoicing

## GAURI'S SOLUTION ARCHITECTURE

### 1. SAP Business One Rapid Deployment

- Delivered in three-month timeline ahead of legacy system support deadline
- Template-accelerated implementation minimising customisation and risks
- Configuration for lot and serial traceability on medical device inventory
- Alignment to hospital trust procurement documentation requirements and validation protocols

### 2. Purchase Order and Traceability Configuration

- Serial number and batch tracking throughout receiving and storage
- Supplier lot mapping for linking supplier batches to product lots
- Expiration date tracking for consumable products with shelf life
- Regulatory audit trail for full traceability chain

### 3. Setu-AI Document Intelligence

- Automated matching of supplier delivery notes to purchase orders
- Extraction of lot, serial, and expiration data from supplier documentation
- Automatic quality inspection and rejection handling
- High-volume processing during peak ordering periods

### 4. Trust Procurement Integration

- Integration with hospital trust procurement portals
- Compliance documentation and certification delivery to customers
- EDI integration for purchase order and invoice exchange

## TECHNOLOGIES IMPLEMENTED

Primary: SAP Business One, lot/serial traceability configuration, Setu-AI

Supporting: Procurement portal integration, EDI connectivity

Integration: Trust customer systems for orders and compliance documentation

## KEY RESULTS

Go-Live Achievement: Delivered three months ahead of legacy system deadline

Purchase Order Processing: Delivery-note-to-PO matching time cut by more than half

Manual Data Entry: Reduced to minimal exception handling

Traceability Compliance: Maintained full lot and serial traceability across all hospital trust accounts

Audit Performance: Zero audit findings in first year post go-live

## BUSINESS OUTCOMES

Business Continuity: Successful system replacement on compressed timeline

Competitive Advantage: Fastest device distribution in market due to efficient order processing

Customer Retention: Maintained compliance with NHS trust requirements

Scaling Capacity: Infrastructure in place to support business growth with existing staff

## DEPLOYMENT TIMELINE

Project Duration: Three months from contract to production go-live

Phases: Discovery and fit-to-standard (3 weeks), configuration and build (4 weeks), testing and training (3 weeks), go-live (1 week)

Go-Live Approach: Single cutover on predetermined weekend with extensive testing and hypercare

## MANUFACTURING SECTOR: ALDERTON PRECISION COMPONENTS

### CLIENT PROFILE

Business: Industrial precision manufacturer of automotive and aerospace components

Operations: 3 UK production sites with CNC and specialized manufacturing capabilities

Workforce: Approximately 450 employees

Market: Supply complex, high-precision parts for automotive OEMs and aerospace suppliers

Product Complexity: High SKU count, low production volumes per SKU, complex BOM structures

## BUSINESS PROBLEM

Legacy ERP Fragility: 12-year-old on-premise SAP ECC system heavily customised over time

Upgrade Risk: Customisations made system risky to upgrade, preventing access to modern functionality

Production-Sales Disconnect: Production planning data disconnected from sales forecasts, causing recurring stock-outs on high-demand parts

Inventory Imbalance: Excess inventory on slow-moving lines while high-demand parts frequently out-of-stock

Financial Close Delays: Month-end close taking over three weeks due to complex consolidation logic

Reporting Limitations: Limited insight to production efficiency, yield rates, and cost per unit

## IMPACT OF PROBLEMS

Missed Sales: Stock-outs on high-demand parts resulted in lost revenue and customer dissatisfaction

Cash Tied Up: Excess inventory on slow-moving products tied up working capital

Financial Delays: Month-end close delays prevented timely board reporting and financial decision-making

Competitive Risk: Competitors with more agile supply chains able to respond faster to customer demand

## GAURI'S SOLUTION ARCHITECTURE

### 1. SAP S/4HANA Cloud Migration

- Migration from 12-year-old on-premise ECC system to modern cloud ERP
- Clean-core extensibility approach: custom logic built on SAP Business Technology Platform (BTP) alongside core
- Side-by-side extensions avoiding core modifications that block standard SAP updates
- Modernised user experience and integrated analytics

### 2. Business Process Redesign

- Fit-to-standard analysis against SAP best-practice reference processes
- Simplification of heavily customised legacy workflows
- Lean manufacturing principles applied to material flow and production planning
- Demand planning and sales forecasting integration

### 3. Clean-Core Extensibility on SAP BTP

- Advanced demand forecasting model as side-by-side extension
- Supply chain optimisation logic (safety stock calculation, reorder points)
- Cost allocation and variance analysis for manufacturing
- Preserves upgrade path and support

### 4. Governed Data Foundation

- Cloud data lakehouse connecting production, sales, and finance
- Unified product master across all sites
- Real-time production status and yield tracking
- Material consumption and cost allocation

### 5. Self-Service Analytics Platform

- ThoughtSpot or similar search-driven analytics for production and sales visibility
- Production dashboards (yield rates, machine utilisation, downtime)
- Inventory dashboards (stock levels, turns, obsolescence risk)
- Sales dashboards (forecast accuracy, backlog, customer ship-to-stock)
- Finance dashboards (cost per unit, margin by product, working capital)

### 6. Supplier Document Automation

- Setu-AI for automated supplier invoice and purchase order capture
- Reduction in manual invoice data entry allowing finance team to focus on analysis
- Automatic three-way matching (PO, receipt, invoice) reducing reconciliation work

## TECHNOLOGIES IMPLEMENTED

Primary: SAP S/4HANA Cloud, SAP BTP (clean-core extensions), cloud data lakehouse, self-service analytics

Supporting: Setu-AI for supplier document automation, advanced demand forecasting models

Integration: Direct SAP connectivity to production systems, real-time material consumption tracking

## KEY RESULTS

Month-End Close: Reduced from three weeks to under one week

Stock-Out Incidents: High-demand part stock-outs fell by more than half within two quarters

Production Planning: Demand forecasts integrated with production schedules reducing both stock-outs and excess inventory

Finance Efficiency: Manual invoice data entry reduced by approximately 70%

System Modernisation: Legacy risks eliminated through migration to cloud with upgrade path preserved

## BUSINESS OUTCOMES

Improved Profitability: Better inventory management reduced working capital requirements

Increased Customer Satisfaction: Faster delivery of high-demand parts through improved planning

Operational Agility: Ability to take regular SAP updates and access new functionality

Data-Driven Operations: Real-time visibility to production efficiency and costs enabling continuous improvement

## DEPLOYMENT TIMELINE

Project Duration: 6-month implementation timeline

Phases: Fit-to-standard analysis (month 1), design and BTP extensibility (month 2), configuration and build (month 3), testing (month 4), training and cutover planning (month 5), go-live and hypercare (month 6)

Go-Live Approach: Parallel run with old and new systems followed by controlled cutover

## RETAIL SECTOR: HARLOW & VANCE HOME

### CLIENT PROFILE

Business: Multi-channel homeware and bathroom products retailer

Channel Mix: Approximately 60 physical stores, e-commerce website, trade (B2B) channel

Product Range: Bathroom fixtures, furniture, home accessories

Market: UK residential and B2B market

Challenge: Fragmented channel operations with disconnected customer and inventory data

### BUSINESS PROBLEM

Channel Silos: Store, trade, and e-commerce channels ran on separate systems with no unified customer or inventory view

Store-Digital Disconnect: Store teams could not see online stock levels, leading to lost sales when customers asked about items

Customer Fragmentation: Duplicate customer records across channels from independent customer acquisition

Reporting Limitations: Leadership had no single, trusted view of channel-level performance, margins, or customer behaviour

### IMPACT OF PROBLEMS

Lost Sales: Inability to access inventory visibility across channels meant customers walked out of stores without purchasing

Operational Inefficiency: Manual stock checks to verify online availability wasted staff time

Customer Experience: Duplicate records and inconsistent customer service across channels

Decision-Making Uncertainty: Channel performance and profitability data unreliable and delayed

## GAURI'S SOLUTION ARCHITECTURE

### 1. Salesforce Sales and Service Cloud Unification

- Single customer platform accessible to store associates, e-commerce team, and trade account managers
- Unified customer records eliminating duplicates and providing complete purchase history
- Omnichannel order management from any channel (web, store, phone)
- Integrated customer service access from any touchpoint

### 2. SAP Inventory and Finance Integration

- Inventory system synchronisation between SAP and Salesforce
- Real-time stock level visibility across all stores and distribution centre
- Channel-specific inventory allocation (store stock, online reserved stock, trade allocation)
- Cost and margin consistency across channels

### 3. Semantic Model and Metrics Definition

- Consistent definition of metrics across channels (active customer, channel margin, stock accuracy, customer lifetime value)
- Business-friendly layer defining what metrics mean, avoiding calculation disputes
- Alignment of metrics to finance and operational requirements

### 4. Self-Service Analytics Platform

- Real-time dashboards for store managers (store performance, local inventory, customer activity)
- Category management dashboards (sales, margins, inventory levels, replenishment)
- Channel performance dashboards for executive team (online vs. store vs. trade performance)
- Customer analytics (channel mix, frequency, basket size, lifetime value)

### 5. Data Integration and Governance

- Cloud data lakehouse integrating Salesforce and SAP data
- Customer master reconciliation and deduplication
- Inventory master synchronisation
- Role-based access to sensitive data (costs, margins, customer information)

## TECHNOLOGIES IMPLEMENTED

Primary: Salesforce Sales Cloud, Salesforce Service Cloud, SAP integration, cloud data lakehouse, semantic model, self-service analytics

Supporting: Customer data platform for identity resolution and unification

## KEY RESULTS

Stock Visibility: Online-store stock accuracy improved with cross-channel inventory visibility

Customer Records: Duplicate customer records eliminated through master data management

Reporting Modernisation: Store and category managers moved from monthly spreadsheets to real-time self-service dashboards

Decision Speed: Channel-level profitability and performance data now available within hours vs. weeks

Scalability: Foundation in place to add new channels (marketplace, subscription) without system changes

## BUSINESS OUTCOMES

Improved Customer Experience: Seamless omnichannel shopping and service

Reduced Leakage: Better inventory visibility increased conversion rates

Operational Efficiency: Staff time freed from manual data gathering for value-added work

Profitability: Better understanding of channel margins enabling strategic investment decisions

Growth Enablement: Platform capable of supporting new channels and business models

## DEPLOYMENT TIMELINE

Project Duration: 5-month implementation

Phases: Current-state analysis and data reconciliation (month 1), Salesforce and integration design (month 2), build and configuration (month 2-3), testing and training (month 4), go-live and hypercare (month 5)

## FINANCIAL SERVICES: SYNTHOMER (GLOBAL TRANSFORMATION)

### CLIENT PROFILE

Business: Global specialty chemicals company with operations across multiple continents

Scale: Complex multinational enterprise with business units spanning different markets

Scope: Group-wide digital transformation combining CRM and ERP modernisation

Challenge: Fragmented regional systems and customers across geographies

### BUSINESS PROBLEM

[Synthomer case study positioned as "featured global CRM and ERP transformation case study" but specific problems not detailed in source. Demonstrates Gauri's capability for large-scale, multi-country transformation as differentiated from single-entity, single-country rollouts typical of smaller engagements]

### GAURI'S POSITIONING

Large-Scale Transformation: Capability to manage complex, multi-country Salesforce and SAP programmes

Global Programme Governance: Coordinating delivery across multiple regions

Localisation and Standardisation: Balancing global standards with regional requirements

Multi-Entity Financial Consolidation: Managing complex intercompany transactions and currency consolidation

## **SIGNIFICANCE**

Positions Gauri beyond single-practice (SAP or Salesforce only) into truly integrated platform transformation

Demonstrates ability to execute large, complex transformation programmes extending beyond typical SME implementations

Establishes credibility with global enterprises considering Gauri for similar transformations
